

An event claim that travels with the attendee.

OpenMic turns an organizer's wallet-signed event claim into a QR. The attendee checks the claim, approves a wallet transaction, and gets a receipt they can revisit in their on-device passport.

Create → Scan → Verify

Mobile-first. Wallet-controlled. Anchored on Solana mainnet.

One event QR. A clear check-in.

01 Organizer creates

Choose the event and attendee wallet; connect the issuer wallet.

02 Organizer signs

The wallet signs a short-lived, recipient-bound claim.

03 Attendee scans

Scan the event QR and review the claim in OpenMic.

04 Attendee verifies

Review issuer, event, recipient, expiry, wallet prompt, and receipt.

The wallet keeps control.

Wallet-mediated signing

OpenMic asks the connected wallet to sign.
Private keys stay in the wallet.

Recipient-bound QR

The claim includes the attendee address and expiry; the attendee checks the issuer key.

Explicit transaction review

The claim receipt uses a Solana Memo. It transfers no SOL; the network fee still applies.

Finalized receipt

OpenMic checks the finalized mainnet transaction against the claim before display.

No app can make an unfamiliar issuer trustworthy by itself. Verify the issuer key through a separate trusted channel.

Shown on Android, end to end.

The demo

1:45 portrait cut; organizer QR and attendee scan are shown together in the actual mobile flow.

Mainnet evidence

The film shows the wallet prompt, the transaction review, and the finalized receipt flow in the captured run.

Trust boundary

The organizer claim in this demo is self-issued for testing. No official CLOCK IN issuer key was supplied.

A signature proves that a wallet signed the claim; it does not prove real-world identity or physical presence.

The project team reports its security review is complete. Registration for wallet publisher recognition is planned.

Jupiter's warning remains visible until registration and wallet behavior are confirmed.
